KEYMACRO is an object-oriented macro language that is used to automate common database tasks. It is easy to learn, but powerful enough to handle all your database programming needs. KEYMACRO includes many built-in procedures and objects that make programming with KEYMACRO even easier. These include such things as a command-line parser, SQL-query, and an SQL-client. The simplest way to start using KEYMACRO is by typing a single line of code. This line can be the name of a SQL function or procedure, or an object-oriented macro. KEYMACRO was designed to make programming databases easier. To achieve this goal, the KEYMACRO language is concise and easy to use. The user interface is simple and intuitive. Many database procedures are designed to be extremely easy to use. Perhaps most importantly, using KEYMACRO eliminates the need to write SQL statements for database tasks. This makes the job of the programmer much easier. KEYMACRO is written in the same programming language as your database, so it is easier to learn. KEYMACRO includes a command-line parser and a SQL-client. These tools can be used to create entire database programs. KEYMACRO is the best way to automate common tasks on a SQL Server, Oracle, MySQL, PostgreSQL, or Interbase database. Includes SQL-Client : Programs SQL statements and queries in KEYMACRO. Includes command-line parser: Programs command-line parameters in KEYMACRO. Includes SQL Server CE: Allows you to create a SQL Server CE database and run queries and programs from the SQL Server CE Compact version of the database. Includes DB2: Allows you to run query statements and programs from the DB2 database. You can use the Output Window in Visual Studio to trace out any exceptions that occur during execution. It is a very useful tool to get the necessary information about the crash. You can look at the information in the Event Viewer (Admin >> Event Viewer) to determine the exact reason for a crash. Click here to know more on this topic. Here is the sample output of "select @@version" from the Event Viewer. We can see that the Server version is 14.0.25.0. It is Win32 platform, built for x86. Version information about the operating system and application installed on the server can be used to identify a possible cause of the crash.
