The present invention relates to an optical fiber for transmission of light in the near infrared wavelength region. An optical fiber for transmission of light in the near infrared wavelength region (hereinafter referred to as "NIR wavelength region"), is used in a measuring apparatus or an optical communication system such as a single-mode fiber or a dispersion compensating fiber (DCF) which is used in an optical transmission system for the wavelength band of 1.3 to 1.7. $\mu\text{m}$ . The transmission loss of an NIR wavelength region is about three times as high as that of the wavelength band of the 1.3 to 1.7. $\mu\text{m}$ , the transmission loss is considered to be preferably less than 2 dB/km. FIG. 1 shows the structure of a conventional NIR wavelength region optical fiber. A buffered-zone type fiber ribbon is prepared and a hole 1 of approximately 50. $\mu\text{m}$  in diameter is formed in the central portion of the optical fiber ribbon, and a glass melted under a heavy load at a temperature of 950.degree. to 1050.degree. C. is left as a hole in the central portion. The inner diameter of the optical fiber is approximately 120. $\mu\text{m}$ , and the outer diameter is approximately 250. $\mu\text{m}$ . The NIR wavelength region light is transmitted along the optical fiber between the center hole 1 and cladding 2. A glass 3 is present to prevent the light path from becoming closed
