Creo Elements Direct Modeling 2.3.1 direct CAD software is the ideal choice for designers, draftsmen, and engineers in a wide variety of industries to create, visualise and modify 3D CAD designs. Returning to the previous spreadsheet, I added more columns, to the right of the "Design" column, to get the three named slots sorted into order of entry into the script. Now we'll split the design into sections, using the 2nd row and the 3rd column, and fill in the lower right cells with a value of 1 if the cell above is empty and 0 if it is not. If this is done for all the rows, then the entire design is split into sections. I did it for rows 2 to 6, and all I wrote into the cells was a simple "0". I added a conditional formatting rule with the colouring of the cells from red to blue, corresponding to the cells' values. I'm guessing you don't see all the red cells, and that if you look carefully you'll see the light blue cells are empty. No red cells at all until you've finished the first section. The last step in this short script is to set the value of the leftmost column to "Active", so the light blue cells appear and so their cells down the right end of the row are greyed out and the light blue cells appear at the bottom of the spreadsheet. You can run this as a normal script, or as a custom function by inserting a button in the spreadsheet. I call the function, selecting a row and all the cells above it. The Results Screen

of the script has a couple of options to “Save and Show” this as a Design or a Blank, and to “Save in a different file”. This saves the file to the Scripts folder where all the scripts in this spreadsheet are stored. The choice of what to do next is probably “Design” but there are many alternative options. For the purposes of this example I’ll select “Design”, “Blank” and save the file. This leads us to the Design screen (Figure 3). This screen includes the design as a 3D layout which looks like the screenshot.
