Tinnitus as a symptom of Ménière's disease: a psychophysiological study. Tinnitus as a symptom of Ménière's disease occurs in about one third of patients. The objective of this study was to investigate the influence of central, peripheral, and cognitive factors on tinnitus perception in patients with Ménière's disease. Seventy-two patients were interviewed using a standard questionnaire to assess the severity and characteristics of the tinnitus, as well as tinnitus-associated handicap. A psychophysiological study was carried out, involving 5-s pre-recorded tests: an automated behavioral auditory evoked potential (ABEP), a conventional, sustained-rate ABEP, a mismatch negativity, a dual task with a suppression paradigm, and a pitch matching task. Tinnitus was correctly attributed to Ménière's disease by 66% of patients. A correlation was found between tinn
