OLE-style structured storage (SS) stores content as a collection of parts, but you don't have the direct access to the parts themselves. Instead you have to traverse the hierarchy to find the item you are looking for. Structured Storage Viewer is a complete toolkit to explore SS files and its items. Besides, it can show its content in different forms, such as HEX, plain text, picture, rich text content, or HTML./* * A cask consists of a set of packages. Each package has a name, attributes, * keys, and constraints. The name is the identifier used to access the * package. The attributes are a collection of name/value pairs that define * the package's properties, such as the jar file it was packaged from. The keys * are optional name/value pairs that are used to access data in the package. * The constraints list the restrictions that must be met to allow access to * the package. The constraints are in the form of logical combinations of * relationships between the package key and the constraint. For example, a key * and its associated attribute may have a mandatory relationship that will not * allow the package to be accessed if one of the related constraints fails. */ package eject.policies { import eject.common.storage.EjectKey; /** * The cask class is a container for a set of packages. Analyze content of SS files Manage items and copy details of interest Navigation is comfortable thanks to the side panel displaying a tree list of items. The properties panel is right below, letting you view and modify related items. It also displays checksum values for CRC32, MD5, and SHA1. The content of a selected item can be viewed in multiple forms, such as HEX values, plain text, picture, rich text content, or HTML. Content can't be directly handled, but you can remove items from the SS file and add new ones. Corresponding streams can be saved to file, but also loaded into particular items. Head over to the website — www.headwiki.com/head/index.php — and click "Read or download another copy". One thing to look out for is the file size. I'm running a 50GB SSD, so a 20MB file (lame haha) is plenty! Select a file of your choice and click "Download". That's it! To view information on the file's properties, click on the "Properties" tab in the top navigation. You can view the file size, size of the file's container, date when the file was created, date when the file was last modified, etc. If you are curious about the file's contents, all you have to do is click on "Streams". You can then view the file in different formats (e.g. plain text, HTML, HTML with style sheets, XHTML, etc). If you have any questions, feel free to post them in the comments section!
