factors in gonadotropin-releasing hormone (GnRH) regulatory gene expression. The promoter and enhancer activity of the mouse GnRH gene were analyzed in vitro by transient transfection of somatic cell lines of cells derived from either the gonad or the neural tube. Only fetal mouse cerebellar neurons transfected with the GnRH-A gene had a strong promoter activity. Transfection of medullary thyroid carcinoma cells with both the GnRH-B and the GnRH-A gene showed increased expression of the GnRH gene in the presence of thyrotropin and retinoic acid. Treatment of cerebellar neurons with increased levels of theta class phospho-H3 histone increased the GnRH-A

promoter activity. This effect was blocked by inhibitors of RNA and protein synthesis and in the case of inhibitors of DNA and RNA polymerases. In contrast, inhibitors of phosphorylation of histone H3 or of acetylation of histone H4 showed no effect. The results suggest that GnRH gene expression requires regulatory elements acting at the transcriptional and post-transcriptional level, since increased hist
